Alliance FTP Manager Problem Determination

Page Information

Last updated: 09.01.2016

Table of Contents

Chapter 1: Overview

This document is designed to help the Townsend Security customer support group perform initial problem determination with an FTP Manager customer.

Chapter 2: Initial Information

Please collect the following information before continuing:

- What version of FTP Manager are they using (See main menu **`AMMAIN`** , lower right corner)?
- What version of IBM I operating system (V5R4, V6R1, V7R1, or?)
- What is the failing component (library scan, directory scan, auto-scan, API, etc.)?
- Any changes to the environment (OS upgrade, product upgrade, FTP server upgrade)?

Select one of the following chapters based on the failing component:

Chapter 3: Library Scan without PGP

Is the file in the library being processed and moved to the backup library?

Yes: Skip to next question

No: Be sure the subsystem **ALLFTM100** is started. Be sure the library scan definition is active. Be sure the file action is active. Be sure the file action(s) include the file to be processed.

Not fixed? Escalate to third level support

Is there a failure in the FTP session?

No: Skip to the next question.

Yes: Collect error messages in the **QSYSOPR** message queue. Use **Inquiry** menu, option **1** to **View the application log**. Are you able to resolve the error from that information?

No: Escalate to third level support

Is there a failure in the SCAN_LIBS job in the ALLFTM100 subsystem?

Yes: Review to determine the error.

No: Turn on detailed job logging with program **ANLOGON**. Restart the subsystem. Collect the job log. Send to third level support.

Chapter 4: Library Scan with PGP

Is the file in the library being processed and moved to the backup library?

Yes: Skip to next question

No: Be sure the subsystem **ALLFTM100** is started. Be sure the library scan definition is active. Be sure the file action is active. Be sure the file action(s) include the file to be processed.

Not fixed? Escalate to third level support

Is there a problem in the PGP encryption?

No: Skip to the next question.

Yes: From the **Inquiry** menu take option **6** to **Print the PGP log**. Are there errors? Can you fix them? If not, escalate to third level support.

Is there a failure in the FTP session?

No: Skip to the next question.

Yes: Collect error messages in the **QSYSOPR** message queue. Use **Inquiry** menu, option **1** to **View the application log**. Are you able to resolve the error from that information?

Yes: Problem fixed, exit.

No: Escalate to third level support

Is there a failure in the SCAN_LIBS job in the ALLFTM100 subsystem?

Yes: Review to determine the error.

No: Turn on detailed job logging with program **ANLOGON**. Restart the subsystem. Collect the job log. Send to third level support.

Chapter 5: Library Scan Using SSH sFTP

Is this a new SSH sFTP implementation?

No: Skip to the next question.

Yes: Be sure that the remote SSH sFTP server has been registered to the local system (Configuration, 19 Enroll new SSH server). Be sure to create and send keys to the remote SSH server.

Is the file in the library being processed and moved to the backup library?

Yes: Skip to next question

No: Be sure the subsystem **`ALLFTM100`** is started. Be sure the library scan definition is active. Be sure the file action is active. Be sure the file action(s) include the file to be processed.

Not fixed? Escalate to third level support

Is there a failure in the SSH sFTP session?

No: Skip to the next question.

Yes: Collect error messages in the **`QSYSOPR`** message queue. Use **`Inquiry`** menu, option **`1`** to **`View the application log`**. Are you able to resolve the error from that information?

No: Escalate to third level support

Is there a failure in the `SCAN_LIBS` job in the `ALLFTM100` subsystem?

Yes: Review to determine the error.

No: Turn on detailed job logging with program **`ANLOGON`**. Restart the subsystem. Collect the job log. Send to third level support.

Chapter 6: Directory Scan without PGP

Is the file in the IFS directory being processed and moved to the backup directory?

Yes: Skip to next question

No: Be sure the subsystem **`ALLFTM100`** is started. Be sure the directory scan definition is active. Be sure the file action is active. Be sure the file action(s) include the file to be processed.

Not fixed? Escalate to third level support

Is there a failure in the FTP session?

No: Skip to the next question.

Yes: Collect error messages in the **QSYSOPR** message queue. Use **Inquiry** menu, option **1** to **View the application log**. Are you able to resolve the error from that information?

No: Escalate to third level support

Is there a failure in the SCAN_DIRS job in the ALLFTM100 subsystem?

Yes: Review to determine the error.

No: Turn on detailed job logging with program **ANLOGON**. Restart the subsystem. Collect the job log. Send to third level support.

Chapter 7: Directory Scan with PGP

Is the file in the IFS directory being processed and moved to the backup directory?

Yes: Skip to next question

No: Be sure the subsystem **ALLFTM100** is started. Be sure the directory scan definition is active. Be sure the file action is active. Be sure the file action(s) include the file to be processed.

Not fixed? Escalate to third level support

Is there a failure in the FTP session?

No: Skip to the next question.

Yes: Collect error messages in the **QSYSOPR** message queue. Use **Inquiry** menu, option **1** to **View the application log**. Are you able to resolve the error from that information?

Yes: Problem fixed, exit.

No: Escalate to third level support

Is there a problem in the PGP decryption?

No: Skip to the next question.

Yes: From the **Inquiry** menu take option **6** to **Print the PGP log**. Are there errors? Can you fix them? Can you manually decrypt the file with the **PGPDECRYPT** command?

No: Escalate to third level support.

Is there a failure in the SCAN_DIRS job in the ALLFTM100 subsystem?

Yes: Review to determine the error.

No: Turn on detailed job logging with program **ANLOGON**. Restart the subsystem. Collect the job log. Send to third level support.

Chapter 8: Directory Scan Using SSH sFTP

Is this a new SSH sFTP implementation?

No: Skip to the next question.

Yes: Be sure that the remote SSH sFTP server has been registered to the local system (Configuration, 19 Enroll new SSH server). Be sure to create and send keys to remote SSH server.

Is the file in the library being processed and moved to the backup library?

Yes: Skip to next question

No: Be sure the subsystem **`ALLFTM100`** is started. Be sure the directory scan definition is active. Be sure the file action is active. Be sure the file action(s) include the file to be processed.

Not fixed? Escalate to third level support

Is there a failure in the SSH sFTP session?

No: Skip to the next question.

Yes: Collect error messages in the **`QSYSOPR`** message queue. Use **`Inquiry`** menu, option **`1`** to **`View the application log`**. Are you able to resolve the error from that information?

No: Escalate to third level support

Is there a failure in the `SCAN_DIRS` job in the `ALLFTM100` subsystem?

Yes: Review to determine the error.

No: Turn on detailed job logging with program **`ANLOGON`**. Restart the subsystem. Collect the job log. Send to third level support.

Chapter 9: Auto-scan

Auto-scan for SSH sFTP sessions fails to start when using the `FTMAUTO` command.

Upgrade. This support was added in version 5.20

Does auto-scan fail to start when the subsystem `ALLFTM100` starts?

No: See next question.

Yes: Be sure the auto-scan is in active status. Call the **`ANLOGON`** program and then restart the subsystem. Collect the job log for the auto-scan job (same name as the auto-scan definition). Review for errors and escalate to third level support if needed.

Are there errors in the FTP, SSL FTP, or SSH session?

No: See next question.

Yes: Collect the log from the **`Installation`** menu, option **`1`**. Review the log for errors. If there is an “rm” statement in an SSH sFTP script, remove it and try again. For other FTP errors escalate to third level support.

Does the SSH sFTP session fail to start?

No: See next question.

Yes: See the error messages in the log. Be sure the remote SSH server has been registered to the local system. Be sure the public key has been transferred to the remote server. Be sure the account and password are correct by running a manual sFTP session.

Chapter 10: PGP Encryption

Is the license valid?

Yes: See next question.

Don't know: From a command line run PGP with the –version –verbose options.

No: Obtain a good license file

Does the PGP command report a failure?

No: See next question.

Yes: Run the command with verbose logging. Capture the detailed output. If you still can't determine the error escalate to third level support.

Chapter 11: PGP Decryption

Is the license valid?

Yes: See next question.

Don't know: From a command line run PGP with the –version –verbose options.

No: Obtain a good license file

Does the PGP command report a failure?

No: See next question.

Yes: Run the command with verbose logging. Capture the detailed output. If you still can't determine the error escalate to third level support.

Does the decryption fail in library scan or directory scan?

No: See next question

Yes: Run running the `PGPDECRYPT` command from a command line. Observe any error messages that roll up on the screen. Capture these for analysis.
